CLIMATOLOGICAL DATA

38	VIRGINIA SECTION	
	F. N. HIBBARD	
Vol. XLIV	RICHMOND, VA., YEAR 1934	No. 13

GENERAL SUMMARY

The year as a whole averaged slightly warmer and considerably wetter than usual, with more than usual cloudiness and frequency of rain.

The average temperature, 56.2°, has been exceeded 15 times in the last 44 years; the warmest year was 1921, with a mean temperature of 58.4°; the coolest, that of 1917, with 53.3°. Eight months were warmer than usual, with the July temperature equaling the State record for the month, and the June average, ranking second highest of record. February, with a mean temperature of 28.7°, was the third coldest of record.

Virginia rainfall, 45.73 inches, was 4.20 inches more than normal; the year ranked ninth in point of precipitation and sixth in point of rain frequency. The wettest year was 1906, with an average rainfall of 50.03 inches; the dryest was that of 1930, with an average of 24.99 inches. Unusual amounts fell in certain months: March ranking seventh; September, first; and November, third, in point of wetness as compared with other years. January stood as the third dryest, that month and October also, having but half their usual portion of rain. Snowfall was 30 per cent greater than normal.

Outstanding events of the year were the February cold, sleet, glaze, and snow, with \$100,000 damage to wire systems and \$500,000 damage to roads; the July hail and thunderstorms, with a combined loss approximating \$500,000; the August hailstorms in the northern portion of the Great Valley, with a loss of \$250,000 to fruit; the unusual September rainfall, with an estimated loss of \$600,000; and the unusually high flood waters of December, with damage to property amounting to \$65,000.

Notwithstanding the heavy damage to fruit buds, winter grains and southeastern truck by the cold weather of February, and the slow development of pastures and winter grains by the chill of March, weather conditions through the year were unusually favorable to crops. Some lack of moisture was evident in the Great Valley in early summer, but ample moisture reserve precluded any disastrous effects from summer heat; and the heavy rains of September, although retarding the picking of cotton, developed record crops over the State, particularly in southern counties.

Section and State averages are computed from monthly means.

All other records are used in determining section and division means, but the mean departures from normal temperature and precipitation are based only on records from stationsthat have 10 or more years of observation.

Reference letters, *, b, *, appearing in the tables indicate number of days missing: for example, b represents two days, etc.
†Also on other dates. *Interpolated. †Partially interpolated.

‡Post-office addresses of these stations are as follows: Diamond Springs, Norfolk; Lincoln, Purcellville: Mount Weather, Bluemont.

T. Precipitation is less than 0.01 inch rain or snow.

Depatures in temperature and precipitation corrected to agree with new normals completed in March.

Nore. —In this publication, annual means are computed from data for all stations: whereas, in mouthly reports, means may not include all stations, as in some cases reports are not received in time to be used in the computations. ——All means include the interpolated values.

Monthly and Annual Mean Temperatures for the Year 1934, with Departures from the Normal
